# Agenda

- 0x01. Exposing the RID Hijacking Attack.
- 0x02. A Windows Logon Story.
- 0x03. Hijacking the RID.
- 0x04. Demo.
- 0x05. Conclusions.

# Agenda

0x01. Exposing the RID Hijacking Attack.

0x02. A Windows Logon Story.

0x03. Hijacking the RID.

0x04. Demo.

0x05. Conclusions.

# What is RID Hijacking?

- A new **persistence** technique that affects **ALL** Windows Systems since **NT**. (Haven't tried this on Windows 95 nor Phone ☹).
- A stealthy way to maintain access by **only using OS resources**.
- A method which takes advantage of **important security issues** found at the Windows Security Architecture.

**Not reliable on Domain Controllers (yet).**

# What does it do?

This technique **hijacks the RID** of any **existing user account** on the victim host and assigns it to **another one**.

SID <Guest Account>

=====

S-1-5-2196653972-2908857710-5094559845-501

SID <Guest hijacked Administrator>

=====

S-1-5-2196653972-2908857710-5094559845-500

RID HIJACKING

A diagram illustrating the RID hijacking process. A yellow arrow originates from the RID '501' of the 'Guest Account' and points to the text 'RID HIJACKING'. Another yellow arrow originates from 'RID HIJACKING' and points to the RID '500' of the 'Guest hijacked Administrator'.

# What does it do?

0x01. Assigns the privileges of the **hijacked** account to the **hijacker** one, even if the **hijacked** account is **disabled**.

0x02. Allows to authenticate with the **hijacker** account credentials (also remotely, depending on machine's configuration), and obtain authorized access as the **hijacked** user.

0x03. Permits to register any operation executed on the event log as the **hijacked** user, despite of being logged on as the **hijacker** one.

# What does it do?

0x01. Assigns the privileges of the **hijacked** account to the **hijacker** one, even if the **hijacked** account is **disabled**.

0x02. Allows to authenticate with the **hijacker** account credentials (also remotely, depending on machine's configuration), and obtain authorized access as the **hijacked** user.

0x03. Permits to register any operation executed on the event log as the **hijacked** user, despite of being logged on as the **hijacker** one.

# What does it do?

0x01. Assigns the privileges of the **hijacked** account to the **hijacker** one, even if the **hijacked** account is **disabled**.

0x02. Allows to authenticate with the **hijacker** account credentials (also remotely, depending on machine's configuration), and obtain authorized access as the **hijacked** user.

0x03. Permits to register any operation executed on the event log as the **hijacked** user, despite of being logged on as the **hijacker** one.

# A Windows Logon Story...

# A Windows Logon Story...

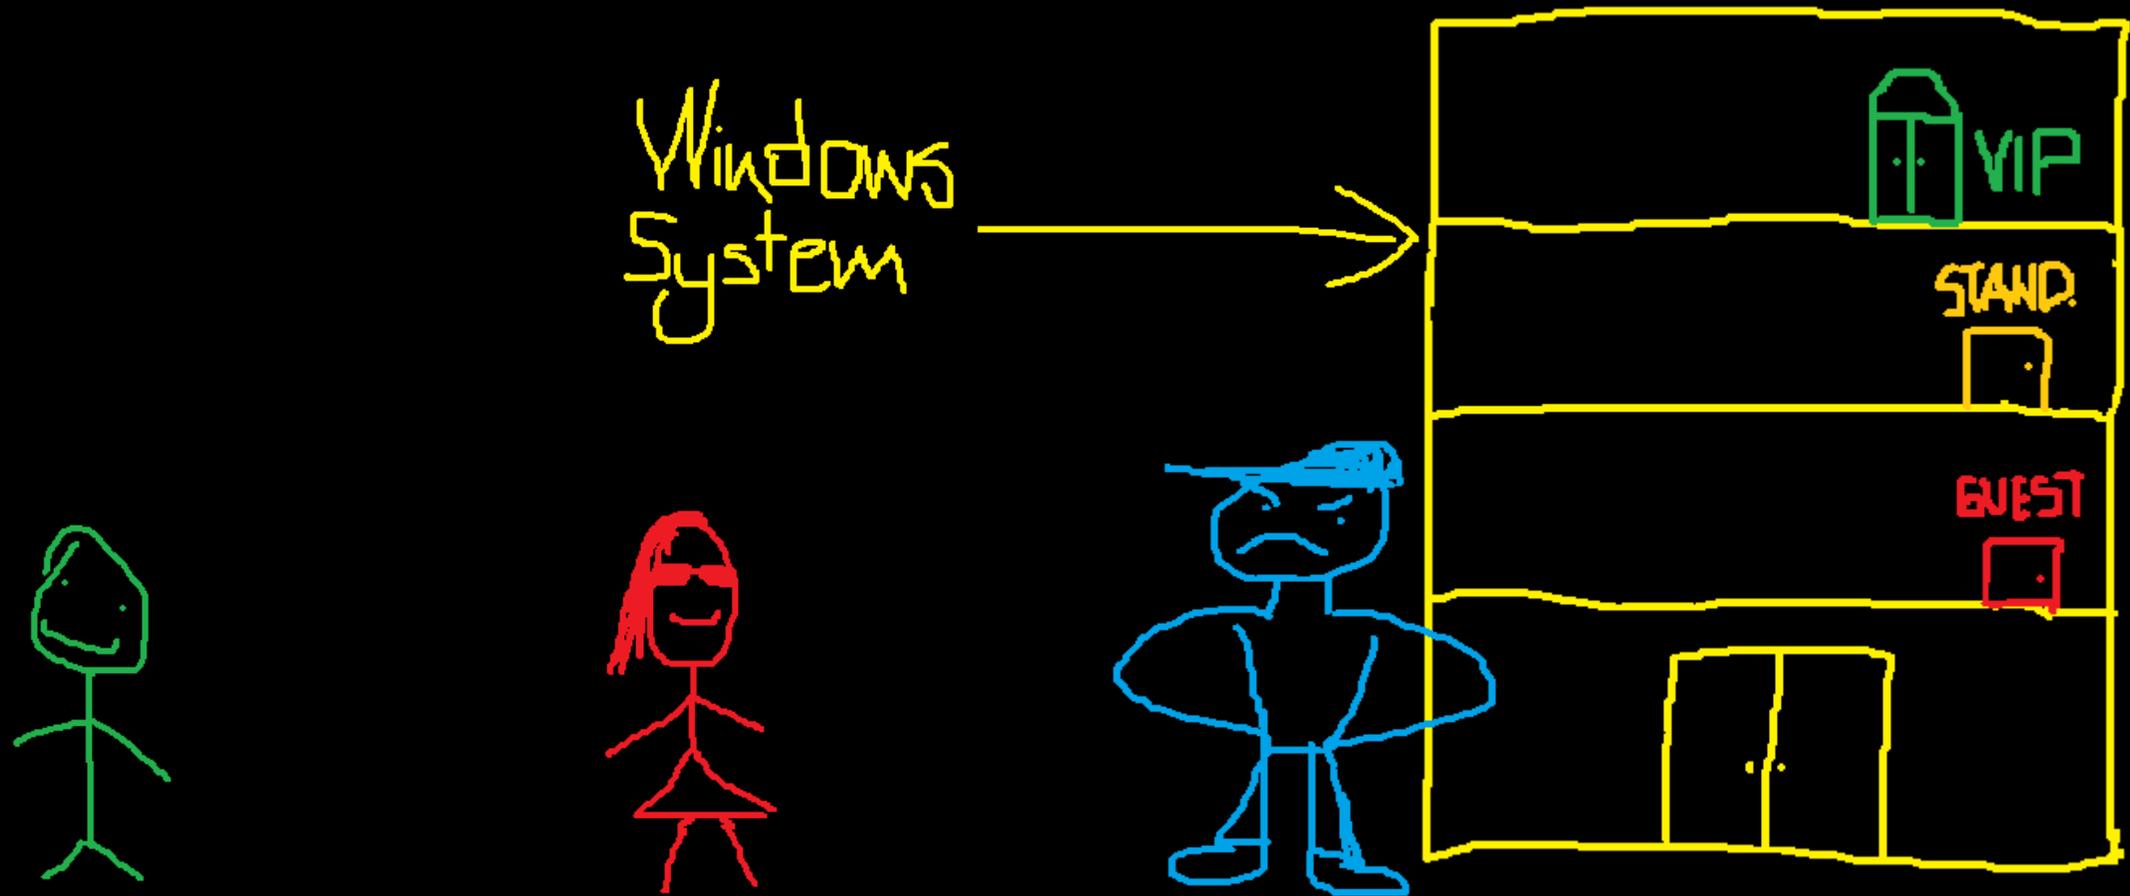

# A Windows Logon Story...

# A Windows Logon Story...

# Windows Security Architecture

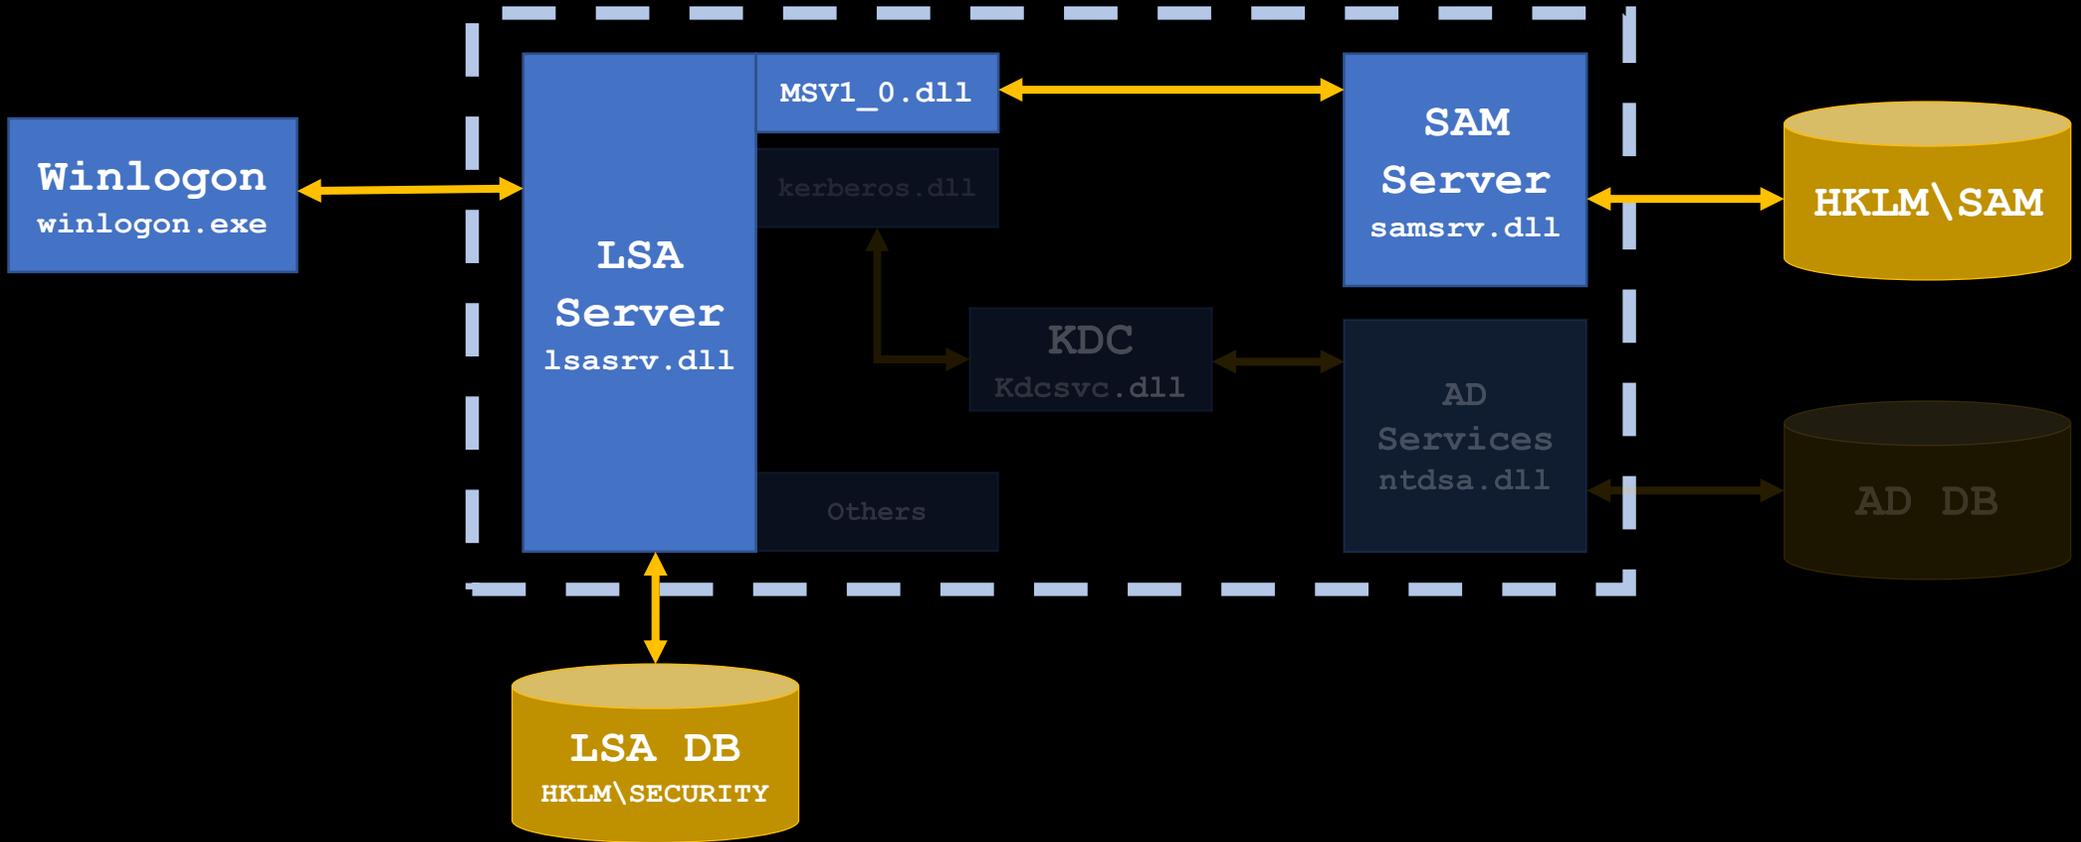

Local Security Authority Subsystem <LSASS>

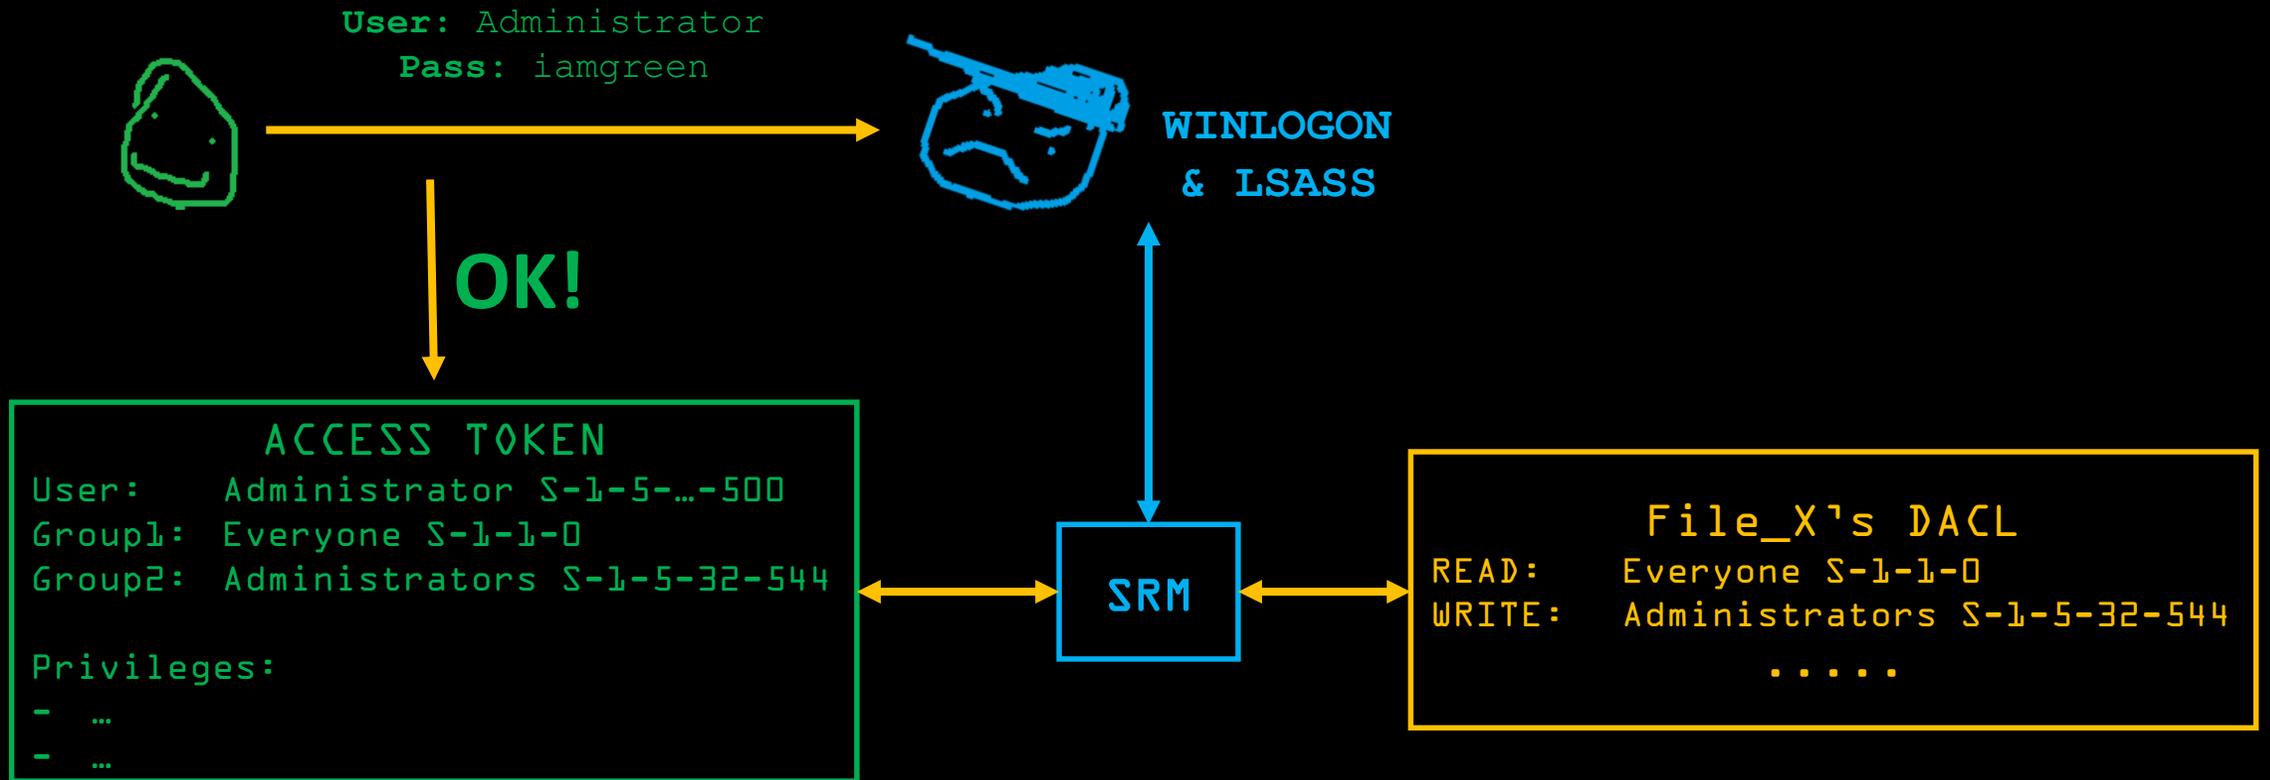

# Windows Security Architecture

Local Security Authority Subsystem <LSASS>

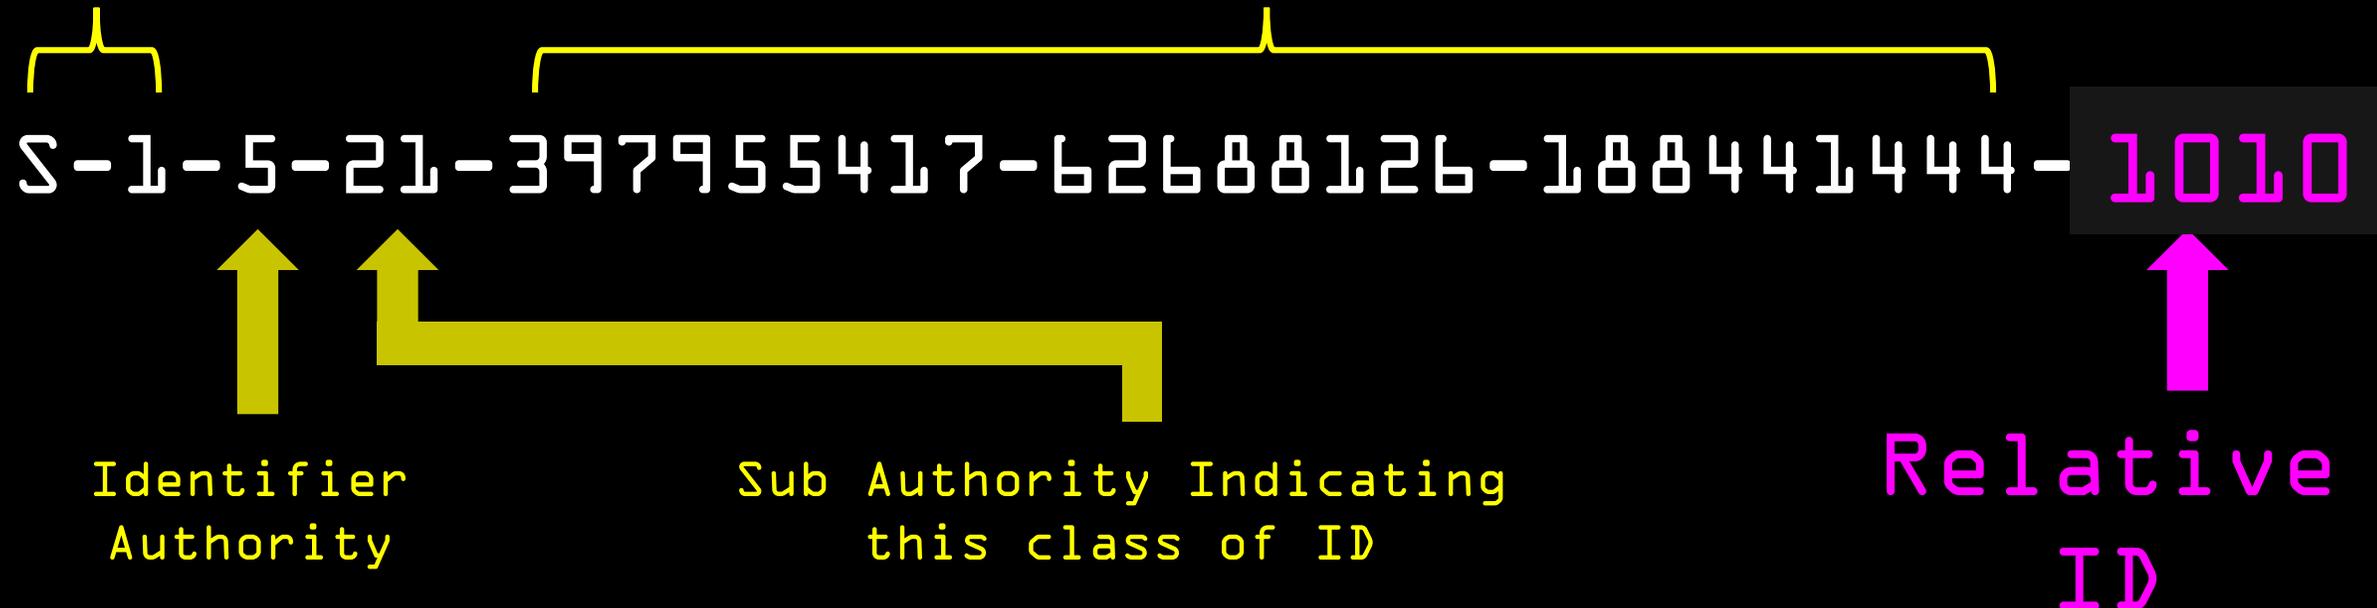

# Quick Logon Overview

# Security Identifiers <SID>

Literal  
prefix

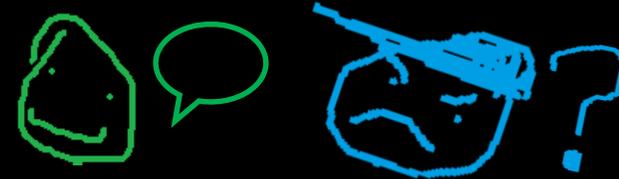

Three Sub Authorities for Uniqueness

# Authentication

# Authentication Steps

0x01. `WINLOGON` Initialization.

0x02. `WINLOGON` calls `LOGONUI` (using CPs).

0x03. `WINLOGON` creates an unique `LOGON SID`.

0x04. `WINLOGON` calls `LSASS` and prepares a handle for an `Authentication Package`.

# Authentication Packages

List: HKLM\SYSTEM\CurrentControlSet\Control\Lsa

For interactive logons:

- <MSV1\_0.dll>: Standalone Authentication.
- <Kerberos.dll>: Domain Kerberos Authentication.

Kerberos authentication package will be ignored by now.

# Authentication Steps

0x05. `WINLOGON` sends logon info to the `MSV1_0` calling `LsaLogonUser`.

## Logon Info:

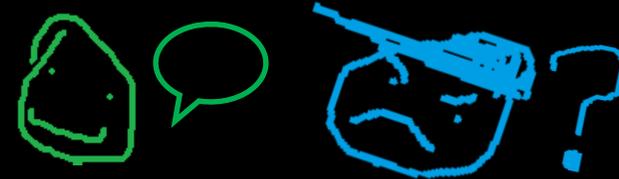

Username/Password.

LOGON SID.

`MSV1_0` is also used on domain-member computers when are disconnected of the network.

# Authentication Steps

0x06. `MSV1_0` sends `username` and `hashed password` to the `SAMSRV`.

0x07. `SAMSRV` queries on the `SAM` database with the `logon data`, retrieving some security info.

# Authentication Steps

- 0x08. `MSV1_0` checks the information obtained from the `SAMSRV` response.
- 0x09. If OK, `MSV1_0` generates a `LUID` for the session.
- 0x0A. `MSV1_0` sends the login information (including `LUID`) to `LSASS`.

All the data sent will be used for the further access token creation.

# Authorization

# Access Token

Object used by the **SRM** to identify the **security context** of a process.

**LSASS** creates an initial **access token** for every user which logs on.

Child processes inherit a copy of the **token** of their creator.

Processes in a user's session will be executed using the same access token.

# Understanding the attack

How is the user **identified** by the system after being successfully **authenticated**?

**S-1-5-2196653972-2908857710-5094559845-500**

How does the system associate an **username** with his **SID**?

# Understanding the attack

How is the user **identified** by the system after being successfully **authenticated**?

**S-1-5-2196653972-2908857710-5094559845-500**

How does the system associate an **username** with his **SID**?

**Using the Samsrv.dll black magic :)**

# Remembering...

0x06. `MSV1_0` sends `username` and `hashed password` to the `SAMSRV`.

0x07. `SAMSRV` queries on the `SAM` database with the `logon data`, retrieving `some security info`.

## Remembering...

0x06. MSV1\_0 sends username and hashed password to the

**How is the username associated**

**with the SID?**

0x07. SAMSRV queries on the SAM database with the logon data, retrieving **some security info.**

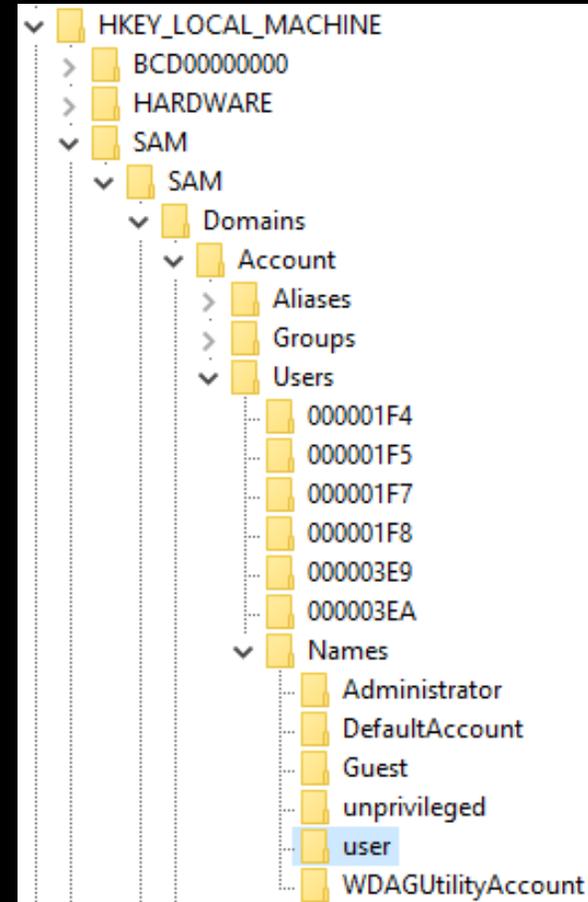

**What security info is retrieved?**

# Samsrv.dll and SAM

SAMSRV looks for the username at the SAM database.

HKLM\SAM\SAM\Domains\Account\Users\Names

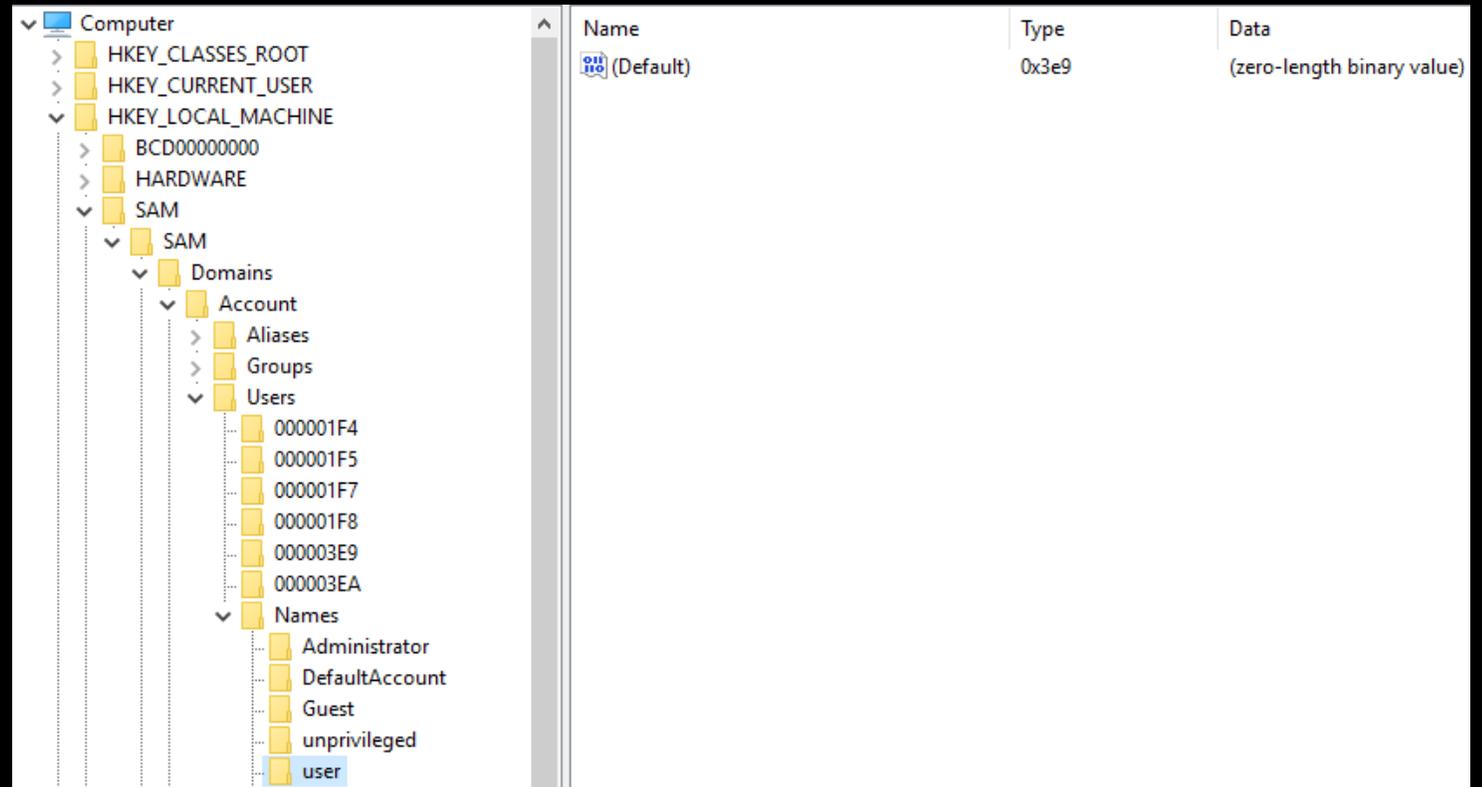

# Samsrv.dll and SAM

HKLM\SAM\SAM\Domains\Account\Users\Names

SAMSRV looks for the username at the SAM database.

Each key contains a REG\_BINARY value.

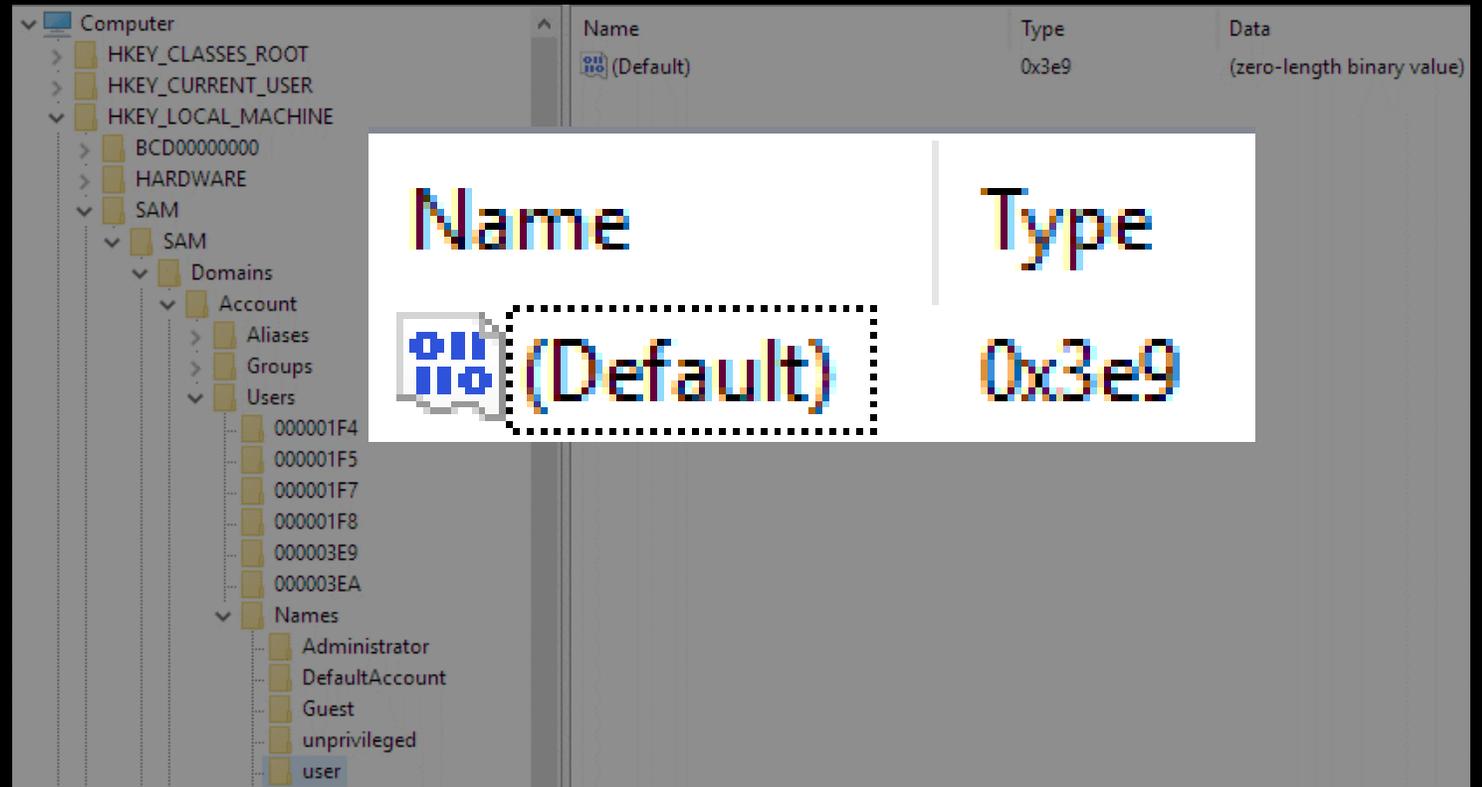

# Samsrv.dll and SAM

SAMSRV looks for the username at the SAM database.

Each key contains a REG\_BINARY value.

The REG\_BINARY has as Type the RID of the account.

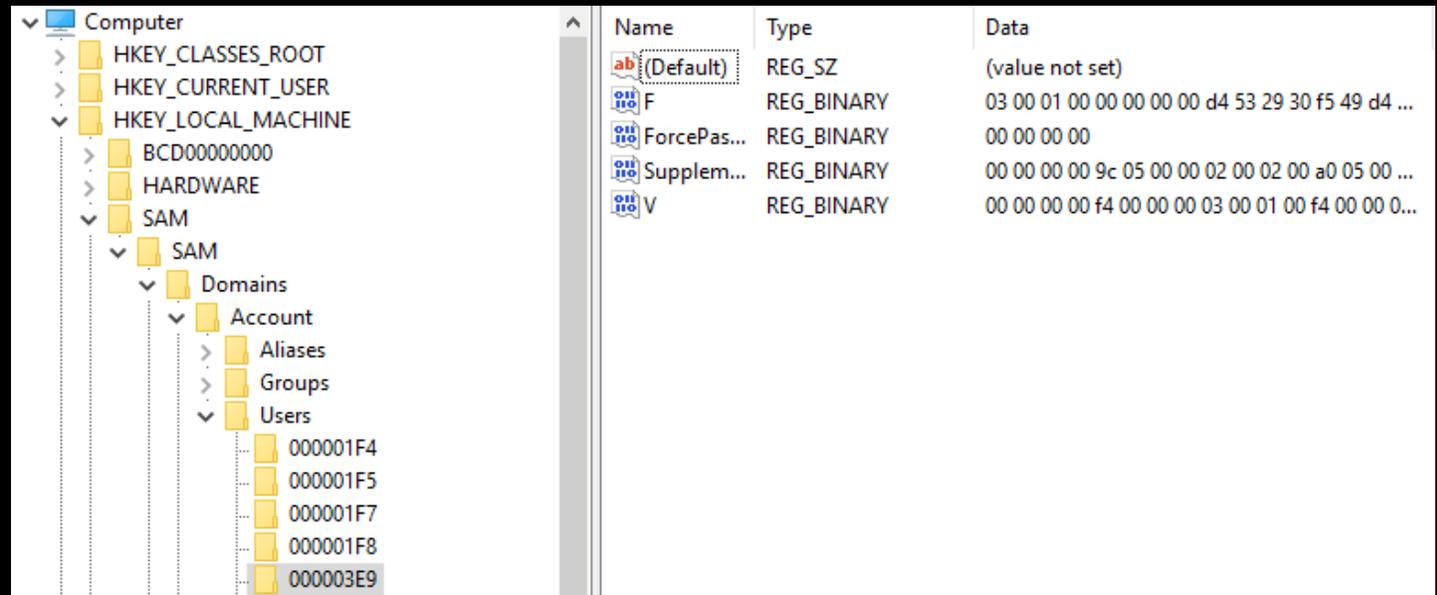

HKLM\SAM\SAM\Domains\Account\Users\Names

# Samsrv.dll and MSV1\_0.dll

HKLM\SAM\SAM\Domains\Account\Users

SAMSRV looks for the key associated with the RID.

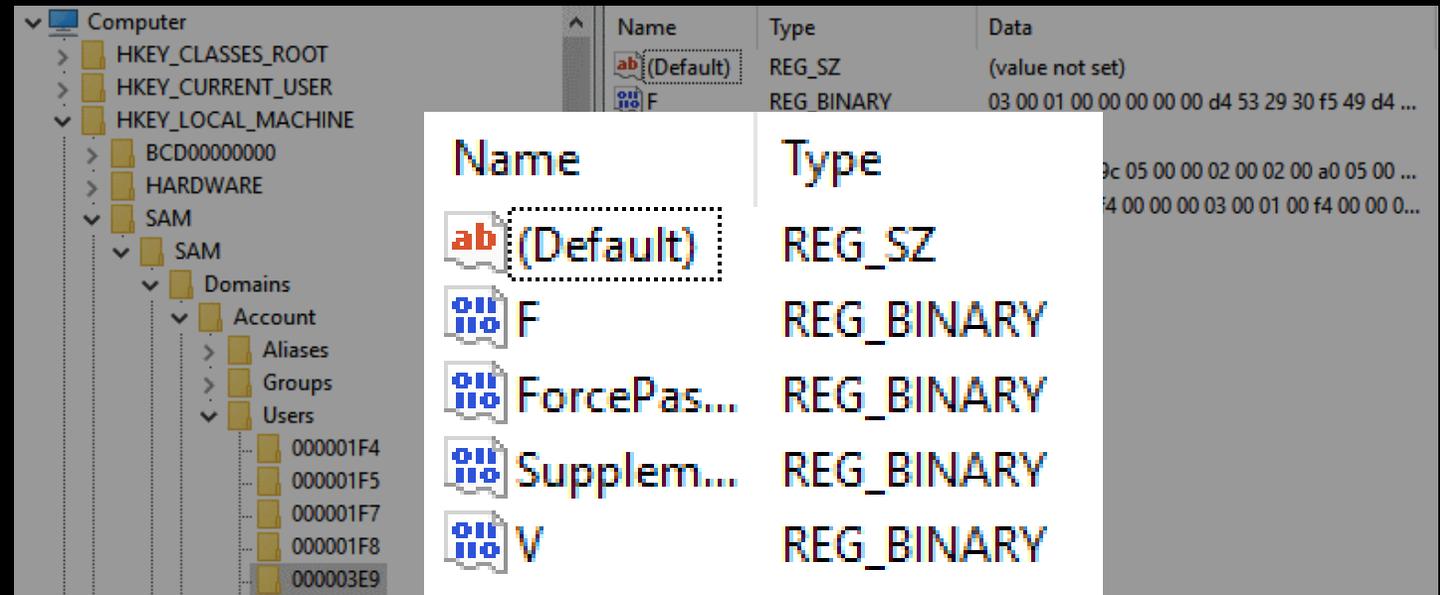

Name	Type	Data
(Default)	REG_SZ	(value not set)
F	REG_BINARY	03 00 01 00 00 00 00 d4 53 29 30 f5 49 d4 ...
